### Outline

- What contrast agents are used in MRI
- Properties of CM
- Patient Interaction with CM
- Managing Adverse Events
- NSF / NFD
- GFR Calculations
- Contrast Stability

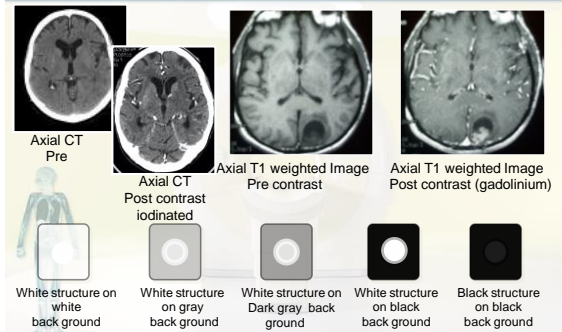

### Purpose of Contrast Media

To alter an inherent contrast property of tissue

Copyright 2009 Imaging Education Associates, LLC. All Rights Reserved. 

### Can We Use Contrast Media in MRI, in CT?

Copyright 2009 Imaging Education Associates, LLC. All Rights Reserved. 

### Contrast Media

- Periodic Table Elements Unique Atomic Structure
- Contrast Media for X-ray, CT, Cardiovascular
  - Ba - Barium
  - I - Iodine
- Contrast Media for MRI
  - Gd - Gadolinium
  - Mn - Manganese
  - Fe - Iron Oxide

1	H	2	He
3	Li	4	Be
11	Na	12	Mg
19	K	20	Ca
27	Co	28	Ni
33	As	34	Se
39	K	40	Ca
45	Rh	46	Pd
51	Sb	52	Te
57	La	58	Ce
63	Eu	64	Gd
69	Tm	70	Yb
75	Re	76	Os
81	Tl	82	Pb
87	Fr	88	Ra

### Gadolinium-Based Contrast Media

*Paramagnetic*

$Gd^{3+}$

*7 un-paired electrons*

- Alters relaxation rates of water-based hydrogen in tissues
  - T1-Relaxation
  - T2-Relaxation
- Gd shortens T1-Relaxation Time
- Gd shortens T2-Relaxation Time

Copyright 2009 Imaging Education Associates, LLC. All Rights Reserved. 

## How does it work?

Relaxation times are mostly dependent on molecular tumbling rates

The bigger the molecule, the slower it tumbles and the faster it relaxes

Gadolinium is a big, slow-tumbling magnet

When gadolinium gets close to a water molecule it slows its molecular tumbling rate which results in faster relaxation rates

The amount of change is given by the relaxivity ( $r_1$ ,  $r_2$ ) of the agent

Copyright 2006 Imaging Education Associates, LLC.  
All Rights Reserved.

Imaging  
Education Associates, LLC

## Mechanisms of Action - Summary

Gadolinium-based

Alter relaxation rates ( $T_1$  and  $T_2$ )

Improve effect

Increase volume

Increase concentration

Increase relaxivity ( $r_1$  and  $r_2$ )

$$\Delta \frac{1}{T_1} = r_1 [\text{Gd}]$$

## Contrast Administration

No patient is to be administered prescription MR contrast agents without orders from a duly licensed physician. Intravenous injection-qualified MR technologists may start and attend to peripheral IV access lines if they have undergone the requisite site-specific training in peripheral IV access and have demonstrated and documented appropriate proficiency in this area. IV-qualified MR technologists may administer FDA-approved gadolinium-based MR contrast agents via peripheral IV routes as a bolus or as a slow or continuous injection as directed by the orders of a duly licensed site physician. Administration of these agents is to be performed according to the ACR policy. The ACR approves of the injection of contrast material and diagnostic levels of radiopharmaceuticals by certified and/or licensed radiologic technologists and radiologic nurses under the direction of a radiologist or his or her physician designee who is personally and immediately available, if the practice is in compliance with institutional and state regulations. There must also be prior written approval by the medical director of the radiology department or service of such individuals. Such approval process must follow established policies and procedures, and the radiologic technologists and nurses who have been so approved must maintain documentation of continuing medical education related to materials injected and to the procedures being performed [30].

## Risk Reduction after Gd

- View optimal metabolic profile
  - Avoid acidosis
  - Adequate dialysis
  - Control phosphorous and calcium
- Regarding transmetalation
  - Avoid -IV Iron infusion
- Dose**
  - Lowest dose possible
  - Avoid repeat dose (2-3 months)
- After Gd
  - Hemodialysis within 2 hours – repeat within 24, maybe 3<sup>rd</sup> round...
    - studies show 3-4 rounds reduce serum GDCA by 97-99%
    - = 11 – 14 hours of dialysis
  - Peritoneal dialysis not efficient – if on PD consider temp Hemodialysis (challenge – no access)

## What can go wrong with Contrast Media (CM)?

### • Side Effects

- Taste
- Warmth
- Nausea

### • Reactions

- Mild
- Moderate
- Severe

How can we interpret  
“what went wrong”  
if we did not know the  
patient status in the  
beginning of the exam?

Copyright 2009 Imaging Education Associates, LLC.  
All Rights Reserved.

Slide # 25

Imaging  
Education Associates, LLC

## Before we begin...

Unfortunately, we get ‘caught up’ in the day-to-day challenges, and tend to become complacent.

- We forget that we are caring for ‘sick’ people.
- We forget that we are injecting ‘drugs’.
- We do not remember what we learned about the anatomy & physiology of the human body.
- We do not understand the interactions of ‘medications’ with the human body.
- We forget that ...

**There usually is more to the story than meets the eye!**

Copyright 2009 Imaging Education Associates, LLC.  
All Rights Reserved.

Imaging  
Education Associates, LLC

## Gadolinium Side Effects

- Mild transitory HA's
- Slight increase bilirubin & blood iron
- Nausea / vomiting
- Urticaria / rash

- Less than 1% anaphylaxis or death

**Be Prepared!**

As Hologic Reimaging 2007 Aug;12(4):309-14  
Safety of magnetic resonance contrast media.  
Runge VM.  
Department of Radiology, Scott and White Clinic and Hospital, Texas A&M University Health Science Center, Temple, Texas, USA.  
Intravenous contrast media, specifically the gadolinium chelates, are well accepted for use in the clinical practice of magnetic resonance imaging. The gadolinium chelates are considered to be very safe and well tolerated and the exceptionally found with indicated contrast media. Minor adverse reactions, including nausea and fever, occur in a low percentage of cases. The four agents currently available in the United States cannot be differentiated on the basis of these adverse reactions. Severe anaphylactic reactions are also known to occur with all agents, although these are uncommon. This review discusses the safety issues involved with intravenous administration of the gadolinium chelates and offers advice. The reader is cautioned to exercise caution and prepare for the possibility of these agents.

Copyright 2009 Imaging Education Associates, LLC.  
All Rights Reserved.

Imaging  
Education Associates, LLC

## Adverse Reactions

Minor reactions occur with all agents in a low percentage of cases

The current 5 agents have similar safety profiles

Anaphylactic reactions are rare

Have occurred with all agents

Sites should be prepared to treat a reaction

V. Runge, *Topics in Magnetic Resonance Imaging*, 2001, Aug; 12(4):309 - 14

Slide # 25

Imaging  
Education Associates, LLC

## Adverse Events Then & Now

### Then in CT

- Happened every day
- Every patient
  - In and Out Patient
  - Same...
- Severity varied
  - We were prepared
  - Benadryl (antihistamine)
  - Tagamet HB
  - Epinephrine

### Then in MRI

- Rarely Happens
- Select patients
- Out patients (more)
- In-Patients (less)
- Severity varies
- We are not prepared
- Drugs are locked up
- Key is ???

### Now in MRI

- Still Rarely Happens
- Seems like MORE...
- Select patients
- Out patients (more)
- In-Patients (less)
- Severity varies
- We are not prepared
- Drugs are locked up
- Key is ???

## Adverse Drug Reactions

- Side effect – “In medicine, an adverse effect is a harmful and undesired effect resulting from a medication or other intervention such as surgery.” Wikipedia
- Adverse reaction –
- Drugs are used on a need vs. risk basis
- Patient must be properly educated regarding potential adverse effects prior to administration
- Idiosyncratic reaction
- Bizarre effects (or idiosyncratic) - dose independent and unpredictable Wikipedia

Copyright©2009 Imaging Education Associates, LLC.  
All Rights Reserved.

## Reaction

### Sensitivity Reactions

- Ex: Bee Sting
- Antibodies mediate distribution of histamines into blood stream
- Body response
  - Reacts or
  - Does not
- Invited Guest

### Fluid Shift

- Ex: Contrast Administration
- Large Molecules need water
- Water
- Leaks out of the extracellular space
- Into the blood stream
- Dragging Histamine with
- Body response
  - Reacts or
  - Does not
- Party crasher

Copyright©2009 Imaging Education Associates, LLC.  
All Rights Reserved.

## “Allergic-Like” Reactions

- Reactions to IV Contrast Media (CM) have the same manifestations as anaphylactic reactions, and they are not true hypersensitivity reactions. ...instead fluid shift...
- Immunoglobulin E (IgE) antibodies are not involved.
- Prior sensitization is not required, nor do they consistently recur in a given patient.
- For these reasons, idiosyncratic reactions to CM are called **anaphylactic reactions**.

Nasir H Siddiqi, MBBS, MD, [emedicine.com](http://www.emedicine.com)

Copyright©2009 Imaging Education Associates, LLC.  
All Rights Reserved.

## “Allergic-Like” vs “Sensitivity” Reactions

### Histamine Release

The release of histamine (hist = because it's made up of histidine residues, amine = because it's a vasoactive amine) causes several allergic symptoms.

- 1) It contributes to an inflammatory response.
- 2) It causes constriction of smooth muscle.

**Histamine reaction is precursor to anaphylaxis**

Copyright©2009 Imaging Education Associates, LLC.  
All Rights Reserved.

## Side Effects & Reactions

- “The most common side effect of iodine includes a warm or hot “flushed” sensation during the actual injection of the iodine and a “metallic” taste in the mouth, which usually lasts less than a minute or so. This can vary depending on the type of iodine used, the rate at which it is administered, and individual patient sensitivity. There is no treatment necessary for this sensation
- Another mild reaction that can take place following the administration of iodine is itching over various parts of the body with hives (bumps on the skin). This reaction can last from several minutes to several hours after the injection. This type of reaction is usually treated with medication administered by the radiologist, nurse, technologist or other physician.
- More serious reactions, although much less likely, may include breathing difficulty, swelling of the throat, or swelling of other parts of the body. These reactions can be more serious if not treated immediately.”

<http://www.imaginis.com/ct-scan/contrast.asp>

Copyright©2009 Imaging Education Associates, LLC.  
All Rights Reserved.

## Classifications of Reactions

- Mild – DOES NOT require treatment
  - Skin reaction
  - Single episode of nausea
- Moderate – OFTEN requires treatment
  - Not considered life threatening
  - Can progress to a more severe reaction if not treated
  - DOES require treatment
- Severe – DOES require treatment
  - May be life threatening
  - May threaten permanent injury such as brain anoxia
- Fatal -

Copyright©2009 Imaging Education Associates, LLC.  
All Rights Reserved.

### Mild Adverse Reactions

- Nausea and vomiting
- Warmth
- Headache
- Dizziness
- Tremors
- Hives/Urticaria
- Pallor
- Hypertension
- Sweats
- Altered taste (metallic)
- Nasal stuffiness
- Swelling of eyes
- Anxiety
- Rash
- Fever/Chills
- Hypertension

Copyright 2009 Imaging Education Associates, LLC. Slide # 21  
All Rights Reserved.

### Moderate Adverse Reactions

- Moderate degree of mild signs and symptoms or
- Systemic symptoms including:
  - Symptomatic urticaria
  - Tachycardia
  - Hypotension (vasovagal)
  - Hypertension
  - Dyspnea – wheezing
  - Bronchospasm
  - Laryngeal edema (mild)
- Close observation

Copyright 2009 Imaging Education Associates, LLC. Slide # 22  
All Rights Reserved.

### Severe Adverse Reactions

- Life threatening
- Moderate to severe laryngeal edema
- Moderate to severe bronchospasm
- Unresponsiveness
- Convulsions
- Contrast-induced nephropathy (CIN)
- Major adverse cardiac events (MACE)
- Arrhythmias
- Cardiopulmonary arrest
- Respiratory arrest
- **Requires prompt recognition and treatment**
- **Almost always requires hospitalization**

Copyright 2009 Imaging Education Associates, LLC. Slide # 23  
All Rights Reserved.

### Vasovagal Response

- Result of stimulation of vagus nerve
- **Bradycardia** and hypotension
- Caused by difficult IV insertion and patient anxiety.
- Abdominal compression
- Not a contrast reaction.
- Elevate legs above heart
- Possibly IV fluids or atropine
- Observation

Copyright 2009 Imaging Education Associates, LLC. Slide # 24  
All Rights Reserved.

### Reported Incidents of Most Frequent AEs

Contrast Agent	No. of Patients	Headache (%)	Nausea (%)	Taste Perversion (%)	Urticaria (%)
Magnevist	1,068	3.6	1.5	0.3	0.3

### MultiHance/Magnevist Study

287 patients enrolled in intra-individual crossover trials

Received MultiHance and Magnevist in 2 separate studies within 14 days

Adverse events rate in these patients was comparable

8% for MultiHance

9% for Magnevist

Saline (control): 17% AE

Post Marketing survey: 0.05%

## ACR: Safe MR Practices 2007

According to the ACR *Manual on Contrast Media*, adverse events after the intravenous injection of gadolinium seem to be more common in patients who had previous reactions to an MR contrast agent.

In one study, 16 (21%) of 75 patients who had previous adverse reactions to MR contrast agents reacted to subsequent injections of gadolinium.

Patients with asthma seem to be more likely to have an adverse reaction to the administration of a gadolinium-based MR contrast agent

Patients with allergies also seemed to be at increased risk (approx 2 - 3.7 times compared with patients without allergies)

**Patients who have had adverse reactions to iodinated contrast media are more than twice as likely to have an adverse reaction to gadolinium (6.3% of 857 patients)**

## MRI & Pregnancy – Gadolinium

The decision to administer a gadolinium-based MR contrast agent to pregnant patients should be accompanied by a well-documented and thoughtful risk-benefit analysis. This analysis should be able to defend a decision to administer the contrast agent based on overwhelming potential benefit to the patient or fetus outweighing the theoretic but potentially real risks of long term exposure of the developing fetus to free gadolinium ions. Studies have demonstrated that gadolinium-based MR contrast agents pass through the placental barrier and enter the fetal circulation. From there, they are filtered in the fetal kidneys and then excreted into the amniotic fluid. In this location the gadolinium-chelate molecules are in a relatively protected space and may remain in this amniotic fluid for an indeterminate amount of time before finally being reabsorbed and eliminated. As with any equilibrium situation involving any dissociation constant, the longer the chelate molecule remains in this space, the greater the potential for dissociation of the potentially toxic gadolinium ion from its chelate molecule. It is unclear what impact such free gadolinium ions might have if they were to be released in any quantity in the amniotic fluid. Certainly, deposition into the developing fetus would raise concerns of possible secondary adverse effects. The risk to the fetus with administration of gadolinium-based MR contrast agents remains unknown and may be harmful.

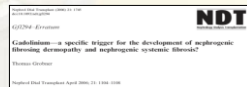

It is recommended that pregnant patients undergoing an MR examination provide written informed consent documenting that they understand the potential risks and benefits of the MR procedure to be performed, are aware of the alternative diagnostic options available to them (if any), and wish to proceed.

## Gd Nephrotoxicity... yes or no?

- Standard IV use/doses
- Not nephrotoxic (usually)
- Iodinated contrast equivalent doses or IA use for DSA
- Nephrotoxicity has been reported
- Debatable if gadolinium performs better than low osmolar iodinated agents
- Patients in Renal failure ... 1998
- Nephrogenic fibrosing dermopathy
- Nephrogenic systemic fibrosis

Copyright©2009 Imaging Education Associates, LLC.

## What's in a name?

This disease was...

- First described in 1997, in 15 dialyzed patients
- Resembled scleromyxoedema
- So... Miss-labeled at first
- First named ...
  - NFD - nephrogenic fibrosing dermopathy (skin)
  - Then ... NSF - nephrogenic systemic fibrosis (organ system)
    - Circulating fibrocytes
    - Systemic nature
- Should be diagnosed by skin biopsy...
  - Generally is not...

Copyright©2009 Imaging Education Associates, LLC.  
All Rights Reserved.

## What are the symptoms?

- After MRI...
  - Skin burning, itching, reddened/darkened patches and/or
  - Inflammation, hardening and/or tightening
- Sclerosing lesions
  - Yellow raised spot of sclera
- Orange peel skin
- Systemic component
  - Joint stiffness
  - Limited peripheral movement
  - Deep hip/rib pain
  - Muscle weakness
  - Sclerosed organs

## Gd in patients with Renal Disease

**Radiology. 2003 Jun;227(3):639-46.**

Gadodiamide administration causes spurious hypocalcemia.

**CONCLUSION:** Gadodiamide administration causes spurious hypocalcemia, particularly at doses of 0.2 mmol/kg or higher and in patients with renal insufficiency.

## Various Gd Agents

**Invest Radiol. 2004 Mar;39(3):138-42**

Comparison of Gd DTPA-BMA (Omniscan) versus Gd HP-DO3A (ProHance) retention in human bone tissue by inductively coupled plasma atomic emission spectroscopy.

**RATIONALE AND OBJECTIVES:** Human bone tissue was collected following administration of a clinical dose of gadolinium chelate (0.1 mmol per kg) to patients undergoing hip joint replacement surgery to determine if measurable differences in Gd deposition occur between 2 widely available magnetic resonance contrast agents.

**CONCLUSION:** Omniscan (Gd DTPA-BMA) left 2.5 times more Gd behind in bone than did ProHance (Gd HP-DO3A).

## NSF – Are Agents Equal?

- Published data: frequency of NSF not equal among all agents (Radiology 2008, 10.1148/radiol.2483072093)
- ACR: differences "may reflect a combination of differences in toxicity and market share"
- ACR: Additional risk factors postulated (high dose, repeat dose, severe liver disease, metabolic acidosis, acute pro-inflammatory event) however none are demonstrated consistently
- Repeating theme
  - Highest risk: patients with poor renal function, high dose, repeat doses, linear non-ionic agents
- Currently no NSF cases with MultiHance, ProHance, Eovist, Dotarem\* or Gadovist\* when they were the only agent used

\*not available in US

## Gd Stability – What Agents?

Stability is related to the ...Affinity...

- Between chelate and Gd
- Of chelate and competing electrolytes
- Dissociation kinetics

Increasing consensus

- More free Gd
- Longer in system
- Higher risk of NSF

Gadolinium Agent	Thermodynamic Stability Constant pH 11.0 (log K <sup>F</sup> )	Conditional Stability Constant pH 7.4 (log K <sup>F</sup> )
Magnevist Gadopentate dimeglumine	22.5	18.4
Prohance Gadoteridol	23.8	17.1
Omniscan Gadodiamide	16.9	14.9
Optimark Gadoversetamide	16.6	15.0
MultiHance Gadobenate dimeglumine	22.6	18.4

**Use of Gadolinium in MRI and MRA Linked to NSF/NFD in Patients With Renal Failure**

**Yael Waisline**

January 2, 2007 — The US Food and Drug Administration (FDA) warned healthcare professionals last week about additional reports of nephrogenic systemic fibrosis/nephrogenic fibrosing dermopathy (NSF/NFD) in patients with renal failure exposed to gadolinium-based contrast agents.

As of December 21, 2006, the agency had received 90 reports of patients with moderate to end-stage renal failure who developed NSF/NFD within 2 days to 18 months after receiving Omniscan (made by Amersham Health, a subsidiary of GE Healthcare), OptiMARK (made by Mallinckrodt, Inc.) or Magnevist (made by Bayer Laboratories, Inc.) for magnetic resonance imaging (MRI) or magnetic resonance angiography (MRA). Some patients had received a high dose of the product, while others had received only 1 dose.

## NFD or NSF – ACR Recommendations

Recommendations:  
At this stage, the following guidelines are recommended when considering administering a GBMCA to patients with renal failure/disease:

The development of NSF in patients with renal disease has followed the administration of some, but not all, of the FDA-approved GBMCAs. To date, the development of NSF has been associated with the isolated prior administration of—especially, and clearly predominantly—Omniscan (at rates that exceed those associated with simple market share), but also Magnevist and OptiMARK.

Nevertheless, it is thought to be appropriate to assume for now that a potential association might exist for all five FDA-approved gadolinium-based MR contrast agents until there are more definitive data to suspect otherwise.

At this time, no special treatment or handling is recommended for kidney disease patients with stage 1 or 2 chronic kidney disease (defined as presence of kidney damage with GFR > 90 mL/min/1.73 m<sup>2</sup> or GFR between 60 and 89 mL/min/1.73 m<sup>2</sup>, respectively).

The only exception to this is that patients with any level of renal disease should not receive Omniscan for their contrast-enhanced MR examinations. This is an opinion shared by others [57] and seems prudent for all renal disease patients. Prospectively checking patient renal function, serum creatinine level, or glomerular filtration rate prior to accepting a patient for an MR imaging or angiographic examination is specifically not required.

Copyright 2010 Imaging Education Associates, LLC. All Rights Reserved.

## NFD or NSF – ACR Recommendations

**Recommendations:**  
**Prospectively checking patient renal function, serum creatinine level, or glomerular filtration rate prior to accepting a patient for an MR imaging or angiographic examination is specifically not required.**

Among the reasons for this is that roughly 90% of NSF patients seem to already be on dialysis and the majority of the remainder seem to be stage 5 or stage 4. Add to this the fact that one could avoid administering any of the agents with which NSF has been most strongly associated, and the fact that even in patients with severe or end-stage renal disease the incidence of developing NSF seems to be around 3–5%. Therefore, specific prospective hematologic screening is not felt to be warranted.

Instead, it is recommended that all requests for MR be prescreened with an additional question inquiring about the presence of a history of “kidney disease or dialysis.” If the disease is present but quite mild (stages 1 or 2), modification of how the study should be performed (relative to a patient with no renal disease) does not appear to be indicated except for the avoidance of Omniscan.

Conversely, if the disease is present and severe or end-stage in nature, the patient will often be aware of this level of kidney disease and will likely be under physician care for this condition.

Copyright 2010 Imaging Education Associates, LLC. All Rights Reserved.

## NFD or NSF – AJKD Recommendations

*The American Journal of Kidney Diseases* states [54]:

**“In general, patients with GFR <30 mL/min/1.73 m<sup>2</sup> should be referred to a nephrologist.”**

Thus, selecting patients with a GFR threshold of roughly 30 mL/min/1.73 m<sup>2</sup> or already on dialysis (i.e., stages 4 and/or 5) as the level for which special consideration (including possibly hemodialysis) should be given, might represent a medically reasonable approach to, and compromise on, this issue. For patients with stage 3 CKD, the potential risks associated with withholding an MR imaging or angiographic examination could outweigh the potential risk of developing NSF, given the very few number of patients with putative GFR < 60 mL/min/1.73 m<sup>2</sup> who have been reported to have developed NSF. Further data are clearly needed to clarify the potential risk for stage 3 CKD patients given the few cases reported and the large number of patients with stage 3 CKD and who are predominantly older than age 70 who would be affected.

Should a new diagnosis of NSF be made, it is recommended that the FDA be notified through their MedWatch program (<http://www.fda.gov/medwatch/>) [11] or by phone (1-800-FDA-1088), and that the international NSF registry at Yale University be notified as well (<http://www.icnldr.org>) [39] to ensure that each database is kept as current as possible on this rapidly changing environment.

## ISMRM Recommendations

**ISMRM Recommendations**

**Background:** The International Society of Magnetic Resonance (ISMRM) is a worldwide organization of magnetic resonance (MR) scientists and engineers. The ISMRM is committed to the advancement of MR technology and its application in medicine, research, and industry. The ISMRM is also committed to the safety of patients and the well-being of the public. The ISMRM is therefore pleased to issue these recommendations regarding the use of gadolinium-based contrast agents (GBCAs) in patients with renal impairment.

**Recommendations:**

- Do not use GBCAs in patients with a creatinine clearance (CrCl) of less than 30 mL/min/1.73 m<sup>2</sup> or a glomerular filtration rate (GFR) of less than 15 mL/min/1.73 m<sup>2</sup>.
- Do not use GBCAs in patients with a CrCl of 30–59 mL/min/1.73 m<sup>2</sup> or a GFR of 15–29 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 60–89 mL/min/1.73 m<sup>2</sup> or a GFR of 30–59 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 90–119 mL/min/1.73 m<sup>2</sup> or a GFR of 60–89 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 120–149 mL/min/1.73 m<sup>2</sup> or a GFR of 90–119 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 150–179 mL/min/1.73 m<sup>2</sup> or a GFR of 120–149 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 180–209 mL/min/1.73 m<sup>2</sup> or a GFR of 150–179 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 210–239 mL/min/1.73 m<sup>2</sup> or a GFR of 210–239 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 240–269 mL/min/1.73 m<sup>2</sup> or a GFR of 240–269 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 270–299 mL/min/1.73 m<sup>2</sup> or a GFR of 270–299 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 300–329 mL/min/1.73 m<sup>2</sup> or a GFR of 300–329 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 330–359 mL/min/1.73 m<sup>2</sup> or a GFR of 330–359 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 360–389 mL/min/1.73 m<sup>2</sup> or a GFR of 360–389 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 390–419 mL/min/1.73 m<sup>2</sup> or a GFR of 390–419 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 420–449 mL/min/1.73 m<sup>2</sup> or a GFR of 420–449 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 450–479 mL/min/1.73 m<sup>2</sup> or a GFR of 450–479 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 480–509 mL/min/1.73 m<sup>2</sup> or a GFR of 480–509 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 510–539 mL/min/1.73 m<sup>2</sup> or a GFR of 510–539 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 540–569 mL/min/1.73 m<sup>2</sup> or a GFR of 540–569 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 570–599 mL/min/1.73 m<sup>2</sup> or a GFR of 570–599 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 600–629 mL/min/1.73 m<sup>2</sup> or a GFR of 600–629 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 630–659 mL/min/1.73 m<sup>2</sup> or a GFR of 630–659 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 660–689 mL/min/1.73 m<sup>2</sup> or a GFR of 660–689 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 690–719 mL/min/1.73 m<sup>2</sup> or a GFR of 690–719 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 720–749 mL/min/1.73 m<sup>2</sup> or a GFR of 720–749 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 750–779 mL/min/1.73 m<sup>2</sup> or a GFR of 750–779 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 780–809 mL/min/1.73 m<sup>2</sup> or a GFR of 780–809 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 810–839 mL/min/1.73 m<sup>2</sup> or a GFR of 810–839 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 840–869 mL/min/1.73 m<sup>2</sup> or a GFR of 840–869 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 870–899 mL/min/1.73 m<sup>2</sup> or a GFR of 870–899 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 900–929 mL/min/1.73 m<sup>2</sup> or a GFR of 900–929 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 930–959 mL/min/1.73 m<sup>2</sup> or a GFR of 930–959 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 960–989 mL/min/1.73 m<sup>2</sup> or a GFR of 960–989 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 990–1019 mL/min/1.73 m<sup>2</sup> or a GFR of 990–1019 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1020–1049 mL/min/1.73 m<sup>2</sup> or a GFR of 1020–1049 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1050–1079 mL/min/1.73 m<sup>2</sup> or a GFR of 1050–1079 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1080–1109 mL/min/1.73 m<sup>2</sup> or a GFR of 1080–1109 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1110–1139 mL/min/1.73 m<sup>2</sup> or a GFR of 1110–1139 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1140–1169 mL/min/1.73 m<sup>2</sup> or a GFR of 1140–1169 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1170–1199 mL/min/1.73 m<sup>2</sup> or a GFR of 1170–1199 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1200–1229 mL/min/1.73 m<sup>2</sup> or a GFR of 1200–1229 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1230–1259 mL/min/1.73 m<sup>2</sup> or a GFR of 1230–1259 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1260–1289 mL/min/1.73 m<sup>2</sup> or a GFR of 1260–1289 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1290–1319 mL/min/1.73 m<sup>2</sup> or a GFR of 1290–1319 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1320–1349 mL/min/1.73 m<sup>2</sup> or a GFR of 1320–1349 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1350–1379 mL/min/1.73 m<sup>2</sup> or a GFR of 1350–1379 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1380–1409 mL/min/1.73 m<sup>2</sup> or a GFR of 1380–1409 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1410–1439 mL/min/1.73 m<sup>2</sup> or a GFR of 1410–1439 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1440–1469 mL/min/1.73 m<sup>2</sup> or a GFR of 1440–1469 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1470–1499 mL/min/1.73 m<sup>2</sup> or a GFR of 1470–1499 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1500–1529 mL/min/1.73 m<sup>2</sup> or a GFR of 1500–1529 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1530–1559 mL/min/1.73 m<sup>2</sup> or a GFR of 1530–1559 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1560–1589 mL/min/1.73 m<sup>2</sup> or a GFR of 1560–1589 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1590–1619 mL/min/1.73 m<sup>2</sup> or a GFR of 1590–1619 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1620–1649 mL/min/1.73 m<sup>2</sup> or a GFR of 1620–1649 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1650–1679 mL/min/1.73 m<sup>2</sup> or a GFR of 1650–1679 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1680–1709 mL/min/1.73 m<sup>2</sup> or a GFR of 1680–1709 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1710–1739 mL/min/1.73 m<sup>2</sup> or a GFR of 1710–1739 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1740–1769 mL/min/1.73 m<sup>2</sup> or a GFR of 1740–1769 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1770–1799 mL/min/1.73 m<sup>2</sup> or a GFR of 1770–1799 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1800–1829 mL/min/1.73 m<sup>2</sup> or a GFR of 1800–1829 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1830–1859 mL/min/1.73 m<sup>2</sup> or a GFR of 1830–1859 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1860–1889 mL/min/1.73 m<sup>2</sup> or a GFR of 1860–1889 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1890–1919 mL/min/1.73 m<sup>2</sup> or a GFR of 1890–1919 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1920–1949 mL/min/1.73 m<sup>2</sup> or a GFR of 1920–1949 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1950–1979 mL/min/1.73 m<sup>2</sup> or a GFR of 1950–1979 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 1980–2009 mL/min/1.73 m<sup>2</sup> or a GFR of 1980–2009 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2010–2039 mL/min/1.73 m<sup>2</sup> or a GFR of 2010–2039 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2040–2069 mL/min/1.73 m<sup>2</sup> or a GFR of 2040–2069 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2070–2099 mL/min/1.73 m<sup>2</sup> or a GFR of 2070–2099 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2100–2129 mL/min/1.73 m<sup>2</sup> or a GFR of 2100–2129 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2130–2159 mL/min/1.73 m<sup>2</sup> or a GFR of 2130–2159 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2160–2189 mL/min/1.73 m<sup>2</sup> or a GFR of 2160–2189 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2190–2219 mL/min/1.73 m<sup>2</sup> or a GFR of 2190–2219 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2220–2249 mL/min/1.73 m<sup>2</sup> or a GFR of 2220–2249 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2250–2279 mL/min/1.73 m<sup>2</sup> or a GFR of 2250–2279 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2280–2309 mL/min/1.73 m<sup>2</sup> or a GFR of 2280–2309 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2310–2339 mL/min/1.73 m<sup>2</sup> or a GFR of 2310–2339 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2340–2369 mL/min/1.73 m<sup>2</sup> or a GFR of 2340–2369 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2370–2399 mL/min/1.73 m<sup>2</sup> or a GFR of 2370–2399 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2400–2429 mL/min/1.73 m<sup>2</sup> or a GFR of 2400–2429 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2430–2459 mL/min/1.73 m<sup>2</sup> or a GFR of 2430–2459 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2460–2489 mL/min/1.73 m<sup>2</sup> or a GFR of 2460–2489 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2490–2519 mL/min/1.73 m<sup>2</sup> or a GFR of 2490–2519 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2520–2549 mL/min/1.73 m<sup>2</sup> or a GFR of 2520–2549 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2550–2579 mL/min/1.73 m<sup>2</sup> or a GFR of 2550–2579 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2580–2609 mL/min/1.73 m<sup>2</sup> or a GFR of 2580–2609 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2610–2639 mL/min/1.73 m<sup>2</sup> or a GFR of 2610–2639 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2640–2669 mL/min/1.73 m<sup>2</sup> or a GFR of 2640–2669 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2670–2699 mL/min/1.73 m<sup>2</sup> or a GFR of 2670–2699 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2700–2729 mL/min/1.73 m<sup>2</sup> or a GFR of 2700–2729 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2730–2759 mL/min/1.73 m<sup>2</sup> or a GFR of 2730–2759 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2760–2789 mL/min/1.73 m<sup>2</sup> or a GFR of 2760–2789 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2790–2819 mL/min/1.73 m<sup>2</sup> or a GFR of 2790–2819 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2820–2849 mL/min/1.73 m<sup>2</sup> or a GFR of 2820–2849 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2850–2879 mL/min/1.73 m<sup>2</sup> or a GFR of 2850–2879 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2880–2909 mL/min/1.73 m<sup>2</sup> or a GFR of 2880–2909 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2910–2939 mL/min/1.73 m<sup>2</sup> or a GFR of 2910–2939 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2940–2969 mL/min/1.73 m<sup>2</sup> or a GFR of 2940–2969 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 2970–2999 mL/min/1.73 m<sup>2</sup> or a GFR of 2970–2999 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 3000–3029 mL/min/1.73 m<sup>2</sup> or a GFR of 3000–3029 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 3030–3059 mL/min/1.73 m<sup>2</sup> or a GFR of 3030–3059 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 3060–3089 mL/min/1.73 m<sup>2</sup> or a GFR of 3060–3089 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 3090–3119 mL/min/1.73 m<sup>2</sup> or a GFR of 3090–3119 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 3120–3149 mL/min/1.73 m<sup>2</sup> or a GFR of 3120–3149 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 3150–3179 mL/min/1.73 m<sup>2</sup> or a GFR of 3150–3179 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 3180–3209 mL/min/1.73 m<sup>2</sup> or a GFR of 3180–3209 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 3210–3239 mL/min/1.73 m<sup>2</sup> or a GFR of 3210–3239 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 3240–3269 mL/min/1.73 m<sup>2</sup> or a GFR of 3240–3269 mL/min/1.73 m<sup>2</sup> unless the potential benefits of the study outweigh the potential risks of NSF/NFD.
- Do not use GBCAs in patients with a CrCl of 3270–3299 mL/min/1.73 m<sup>2</sup> or a GFR of 3270–3299 mL/min/1.73 m
